

FROM BENCH TO BUSINESS

Building the future of in vitro models

How can organ-on-chip technologies and other advanced in vitro methods take the step from the lab bench to becoming a driver for increased drug development efficiency and new biomedical innovations?

This is the topic for an upcoming research and innovation workshop on March 12, organized by the BIRDIE project consortium.

During the workshop, leading experts on microphysiological systems and kidney diseases will discuss what new opportunities these new technologies provide, and what pitfalls and challenges will need to be overcome. Special focus will be given to address what new opportunities the ongoing development means for the future of kidney disease research.

The workshop is only open to invited participants, but a recorded version will be made available after the event. Contact info@birdieproject.eu for more information.

JITSKE JANSEN

Group Leader Target Validation
Sequantrix

ERIC VAN DER VEER

Founder and Chief Innovation Officer
Hybridize Therapeutics

ANDRIES D. VAN DER MEER

Professor of Microphysiological Systems.
Department of Bioengineering Technologies.
Research University of Twente

MAXENCE GAILLARD

Researcher, Centre for Medical Ethics
University of Oslo

CARLOS MOTA

Assistant Professor Department of Complex
Tissue Regeneration
Maastricht University / BIRDIE
